

How to Import the N8n Templates

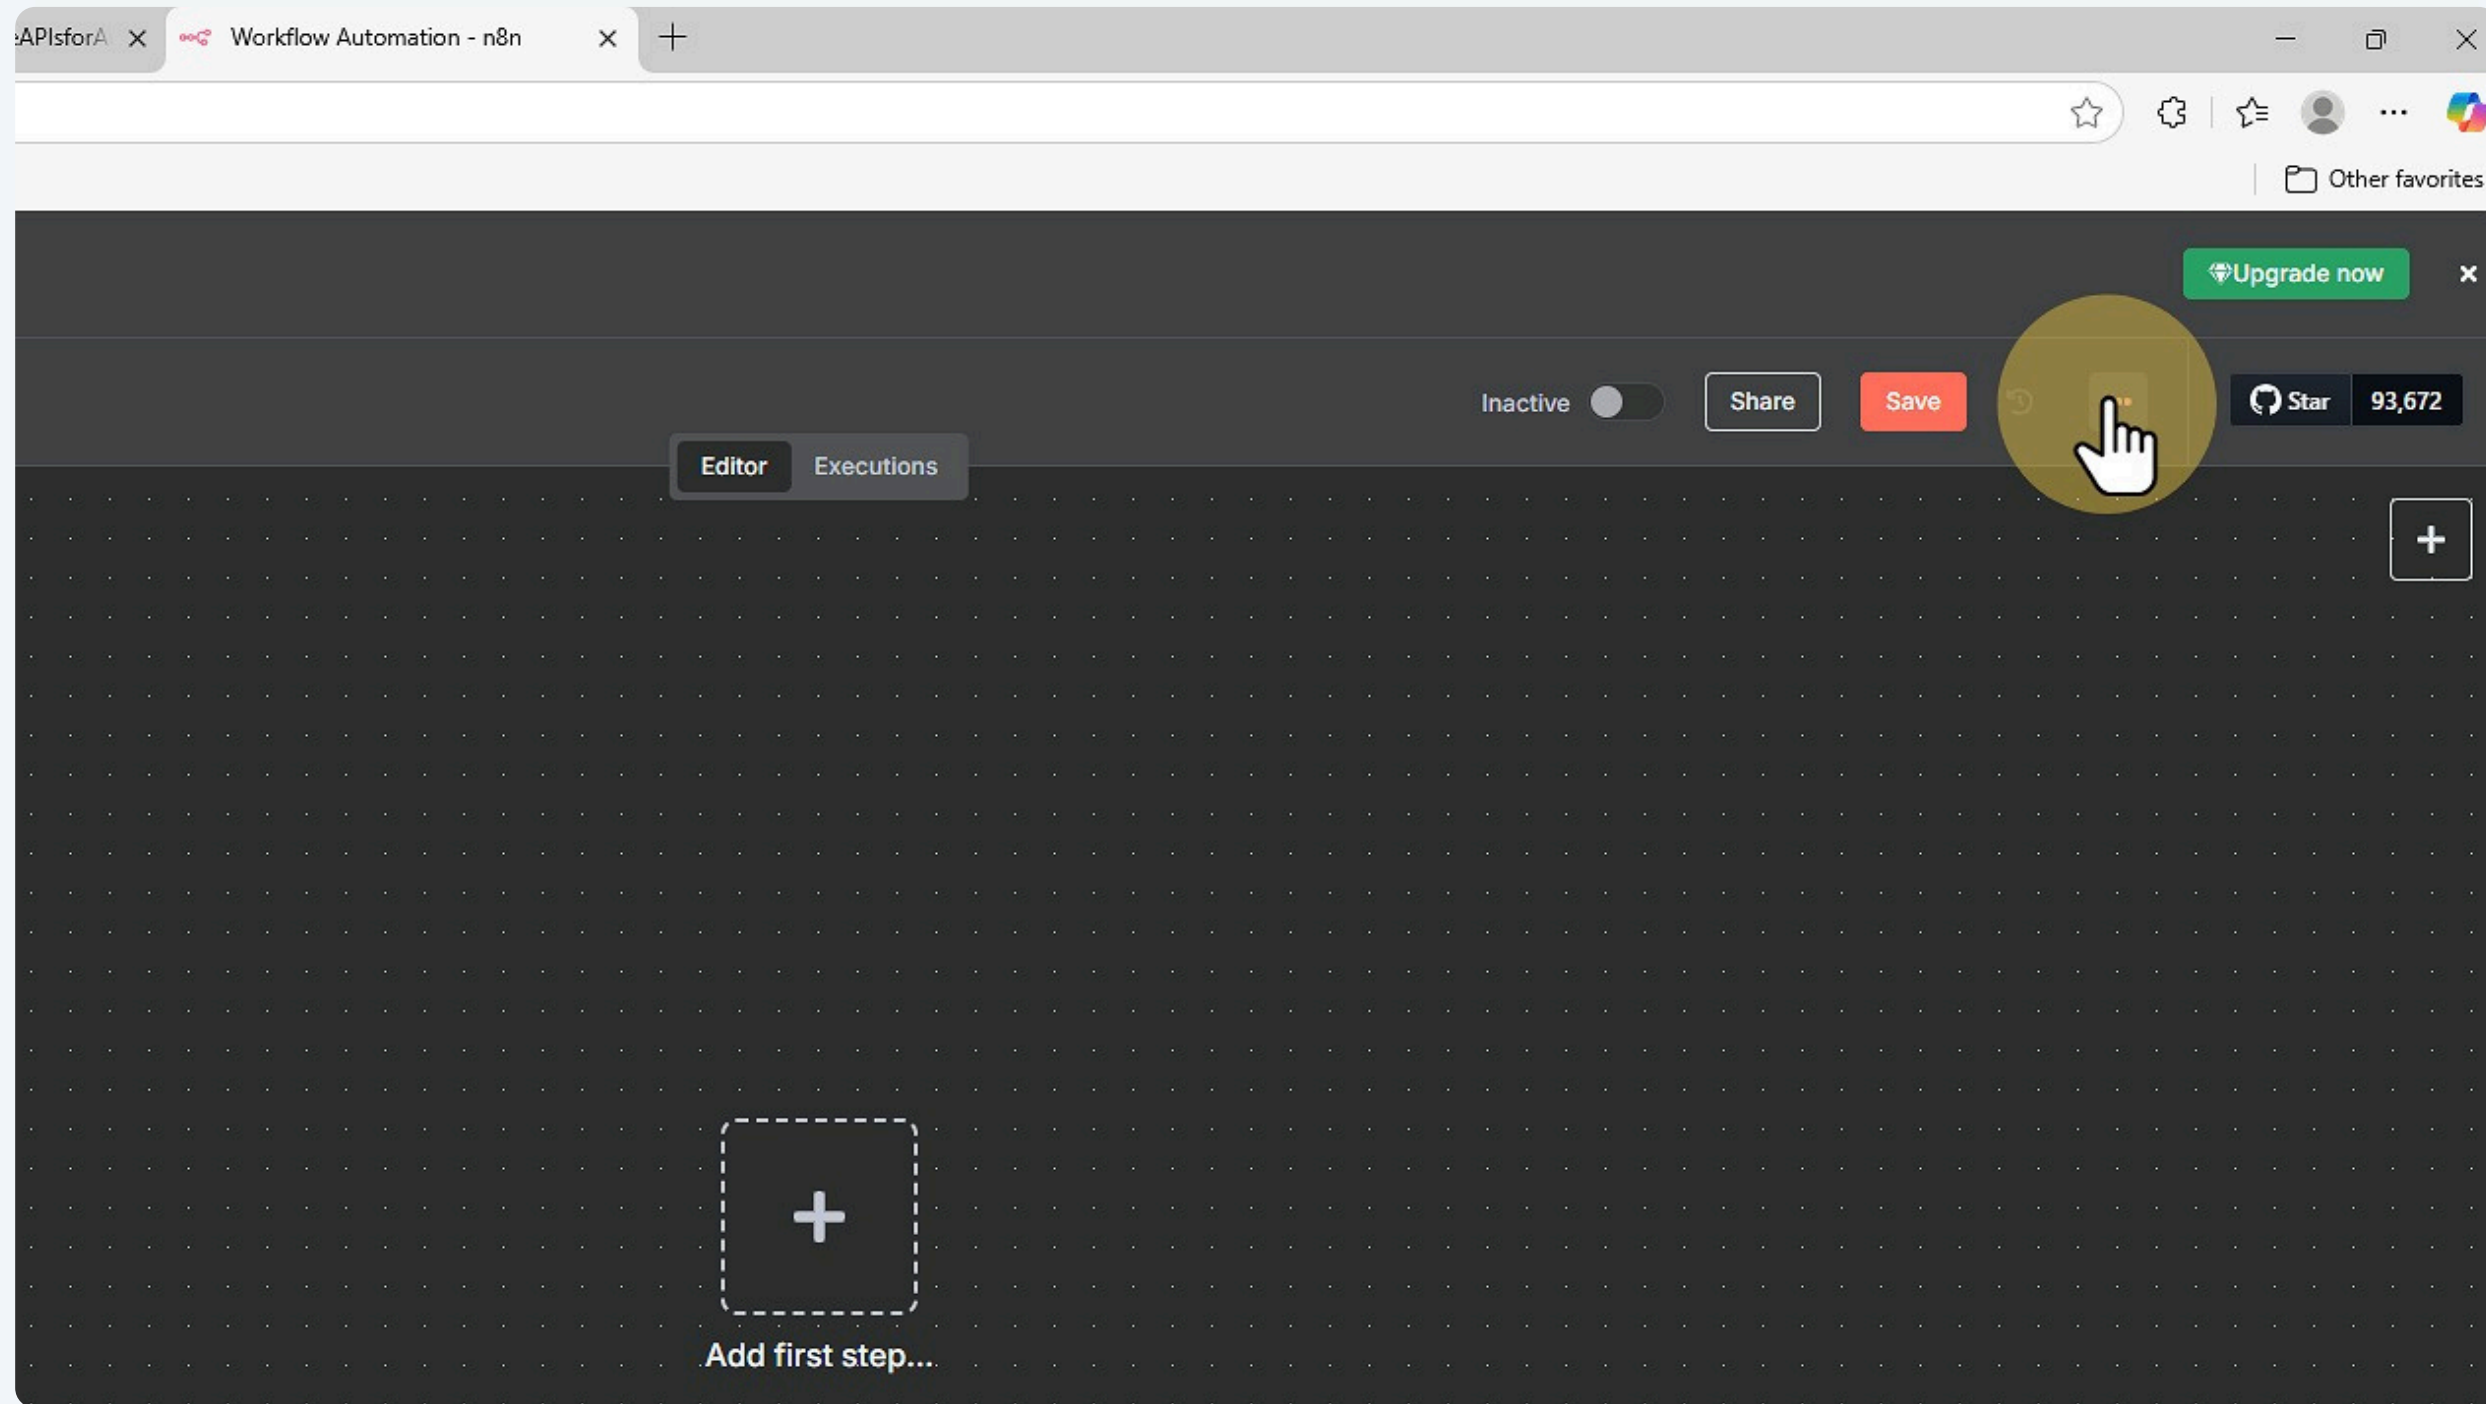

1 Open N8N Platform

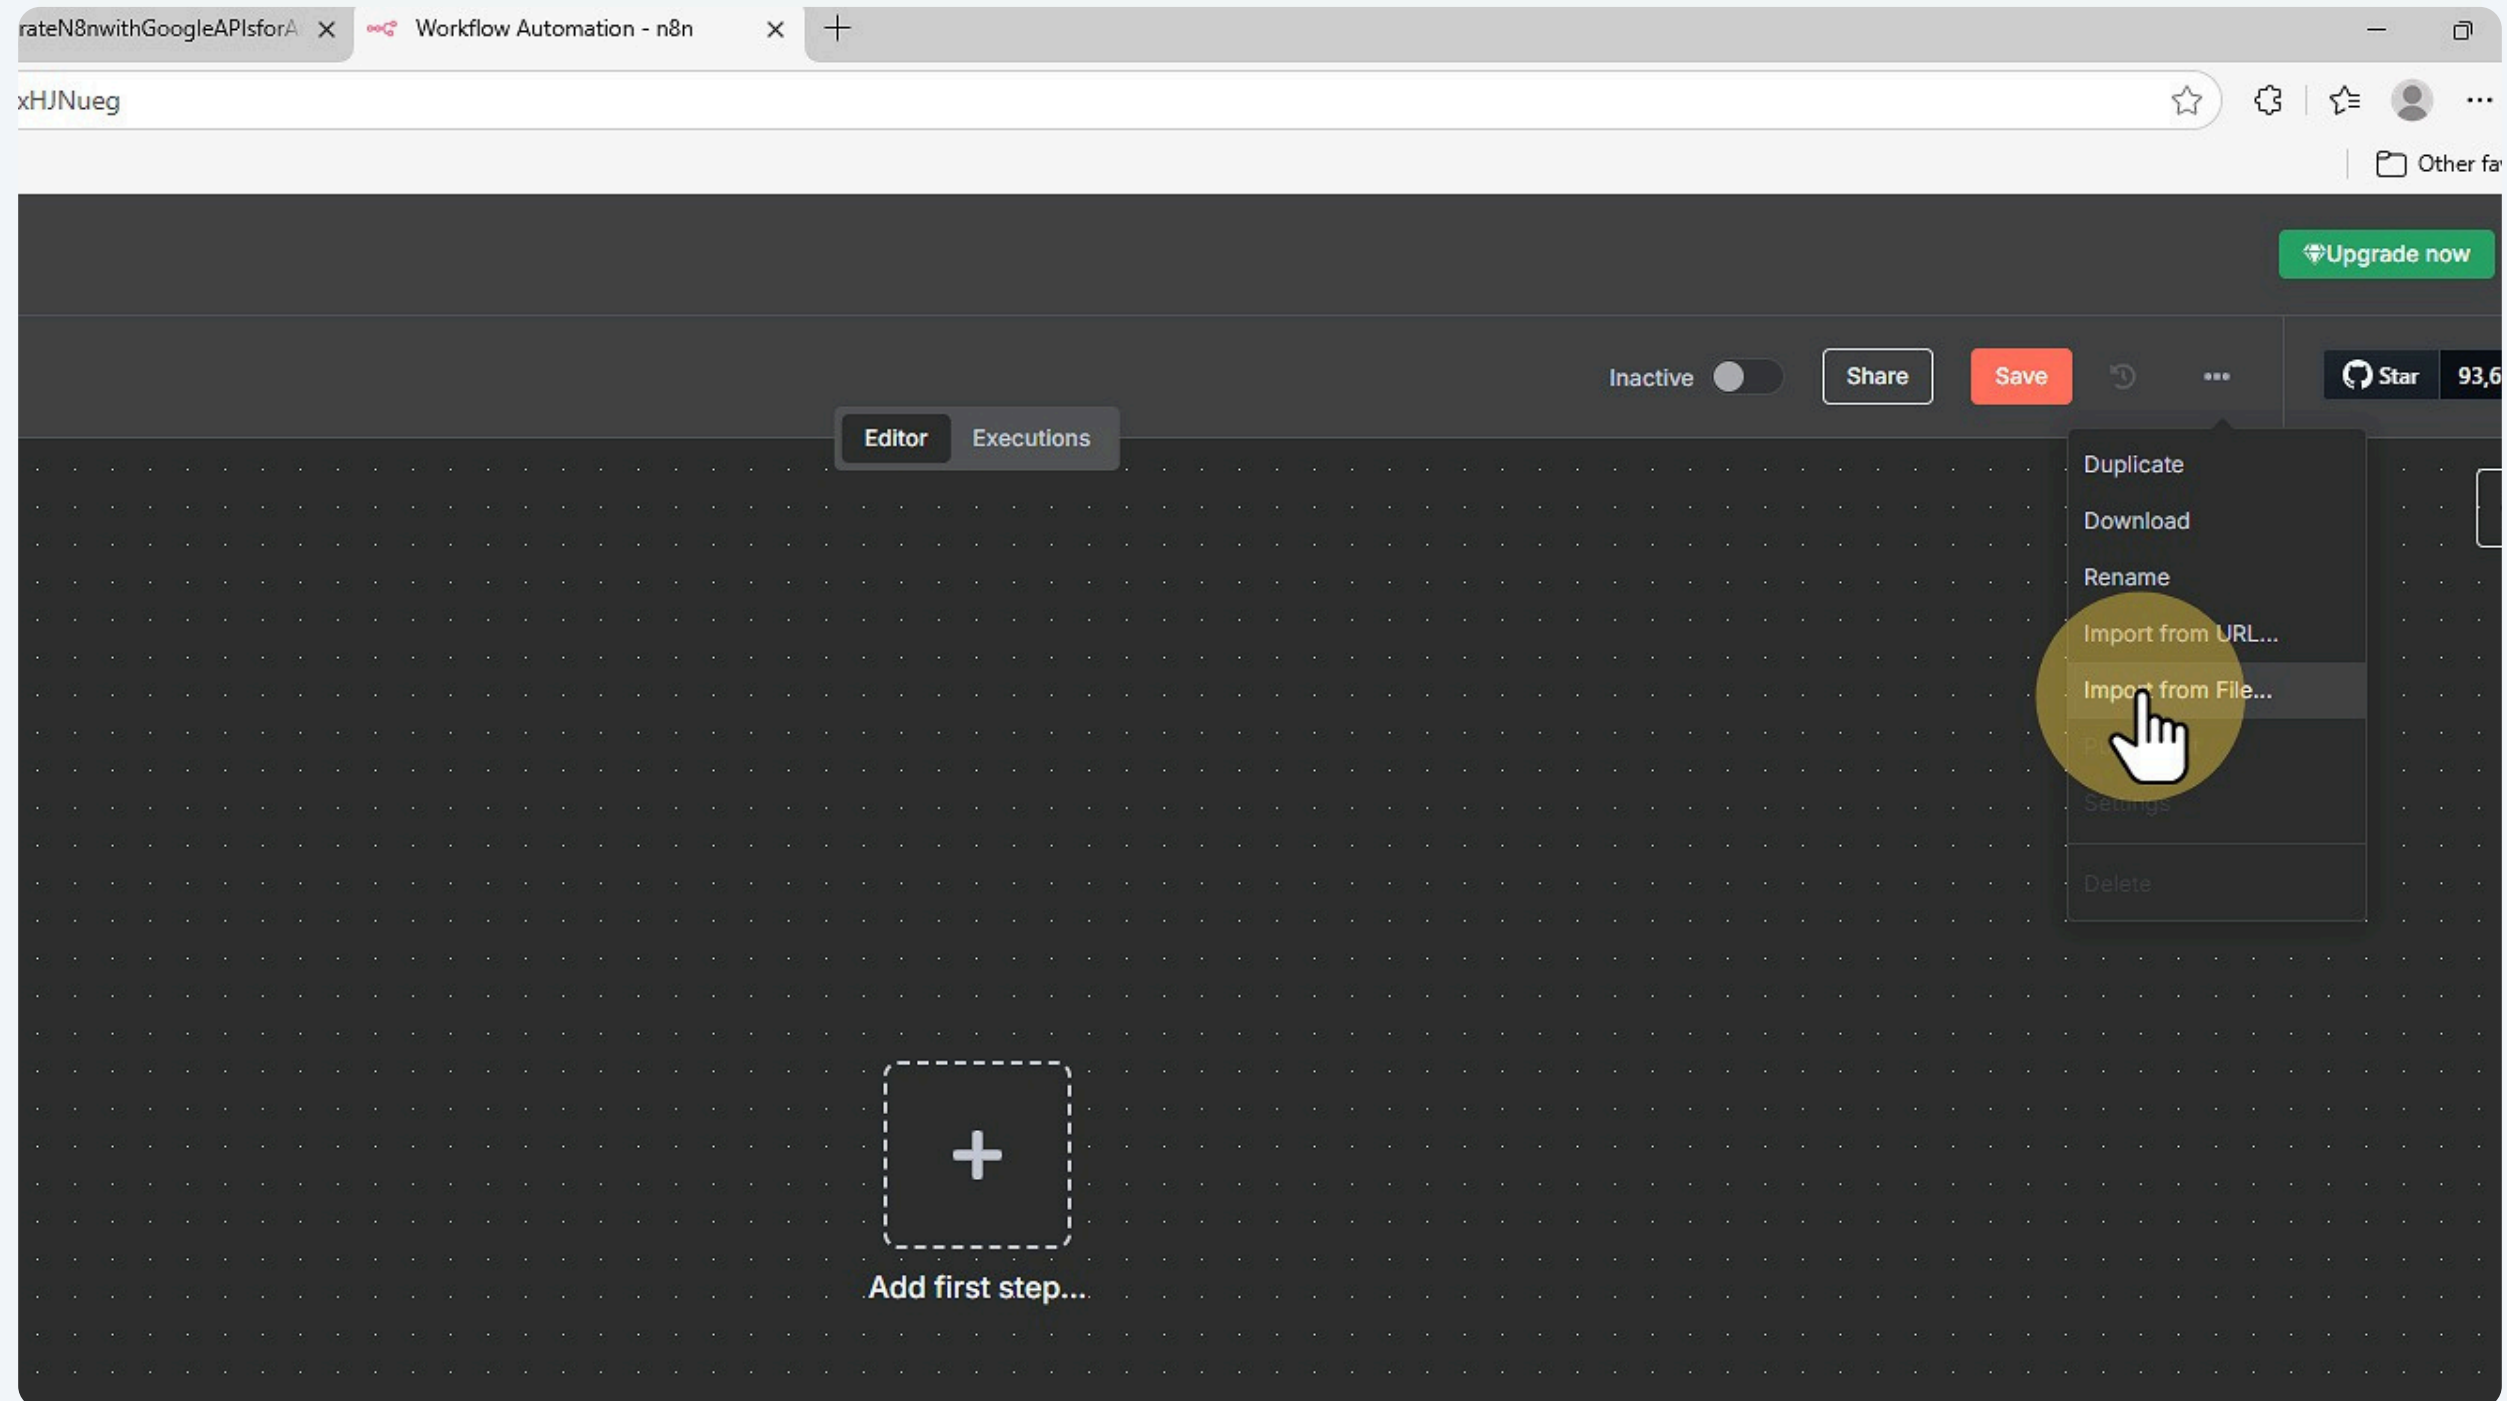

3 Click "Create workflow"

The screenshot shows the n8n Workflows interface. At the top, there's a header with a 'Create Workflow' button highlighted by a hand cursor. Below the header, there's a table with columns for 'Prod. executions', 'Failed prod. executions', 'Failure rate', 'Time saved', and 'Run time (avg.)'. The table is currently empty, with 'Collecting...' status for all columns. Below the table, there's a tabbed interface with 'Workflows', 'Credentials', and 'Executions' tabs. The 'Workflows' tab is active, showing a list of workflows. The first workflow is 'Testing', updated just now, created 8 May, with status 'Personal' and 'Inactive'. The second workflow is 'Workflow', updated 1 day ago, created 13 May, with status 'Personal' and 'Inactive'. At the bottom, there's a pagination bar showing 'Total 2', page '1', and '50/page'.

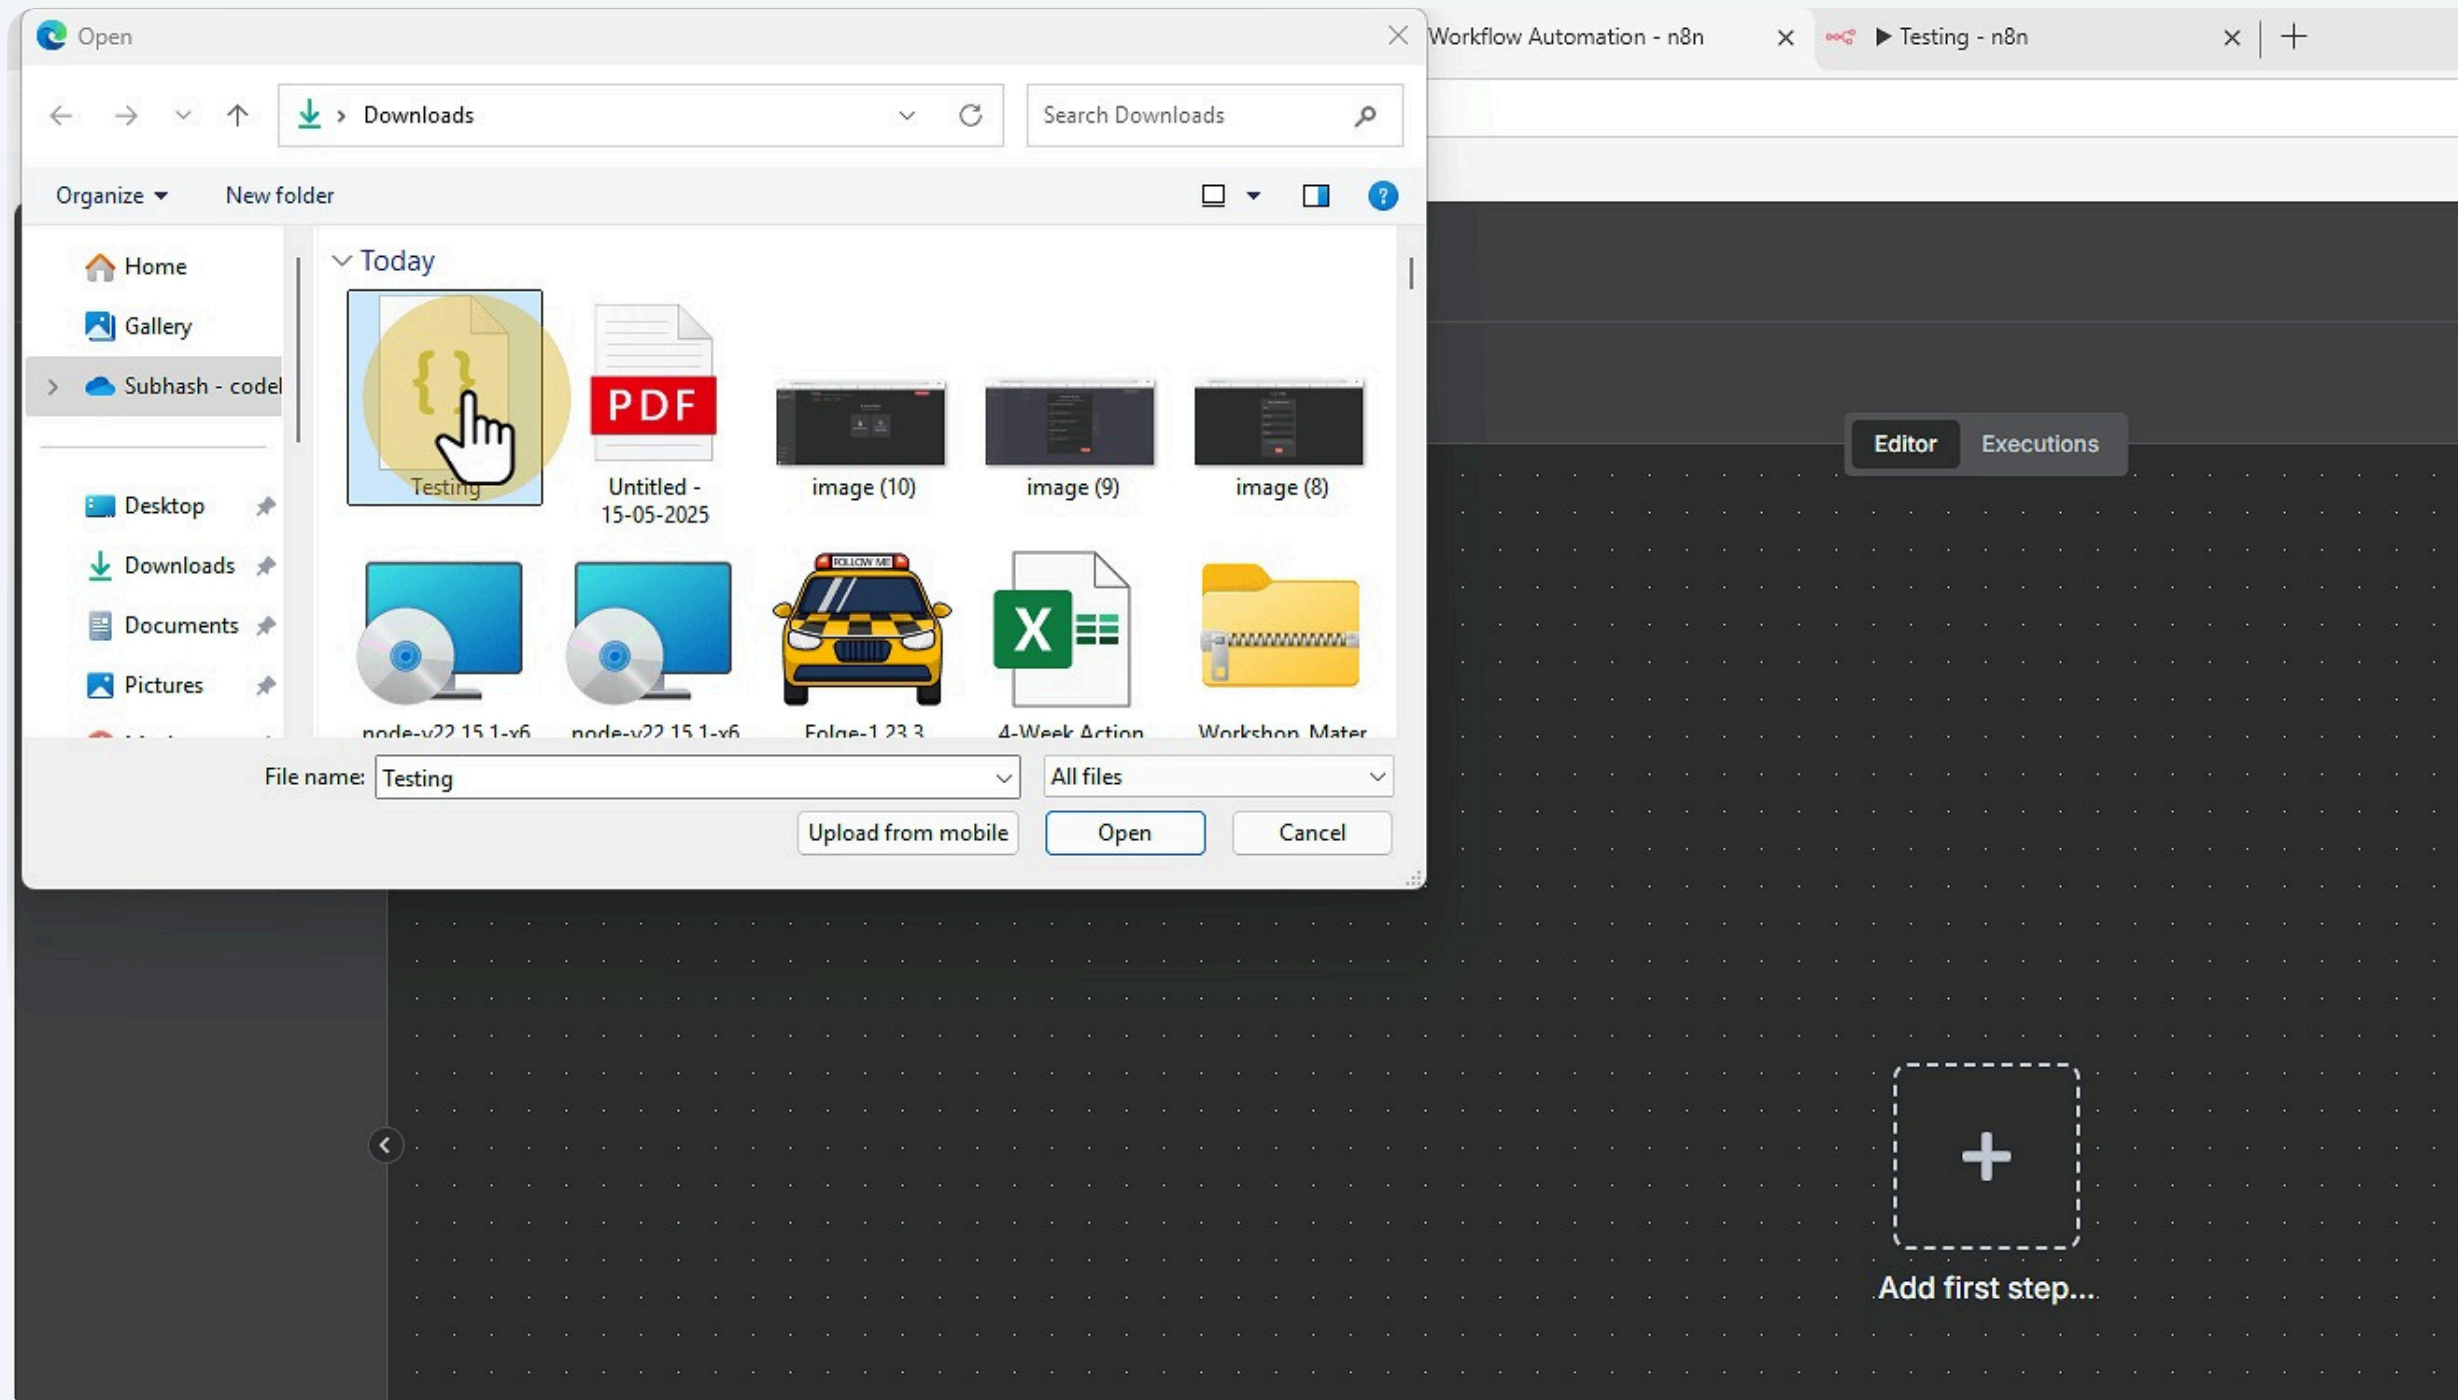

4 Click "Three dots ..."

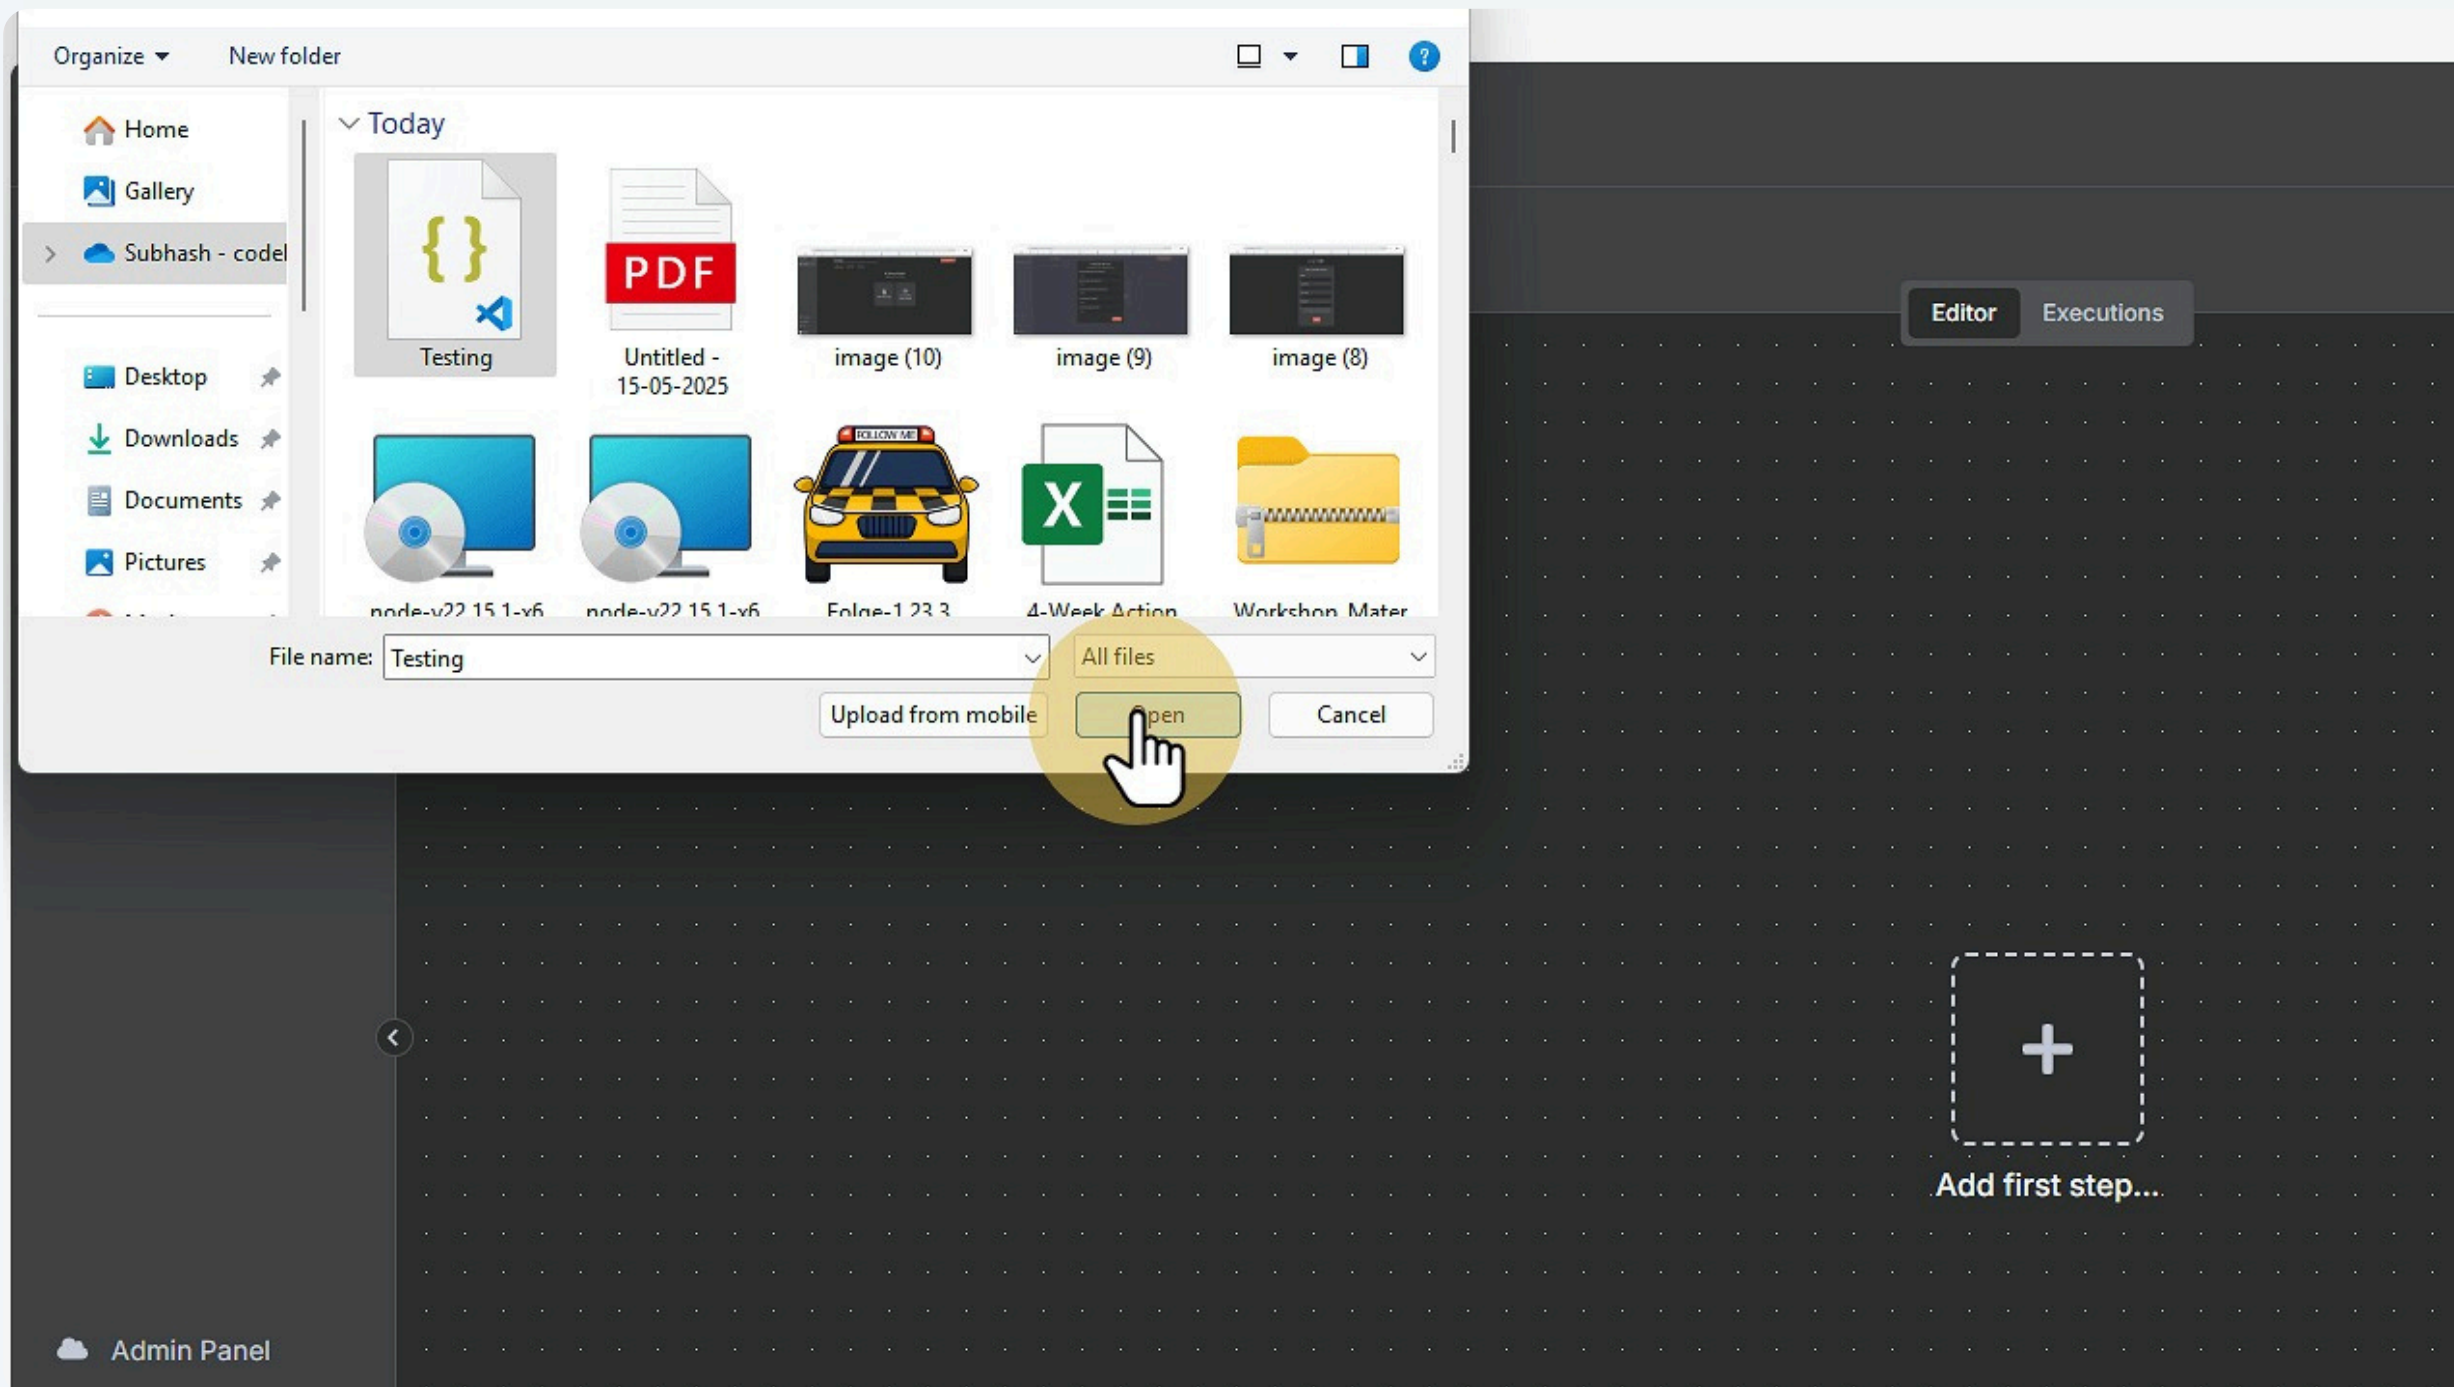

5 Click "Import from File"

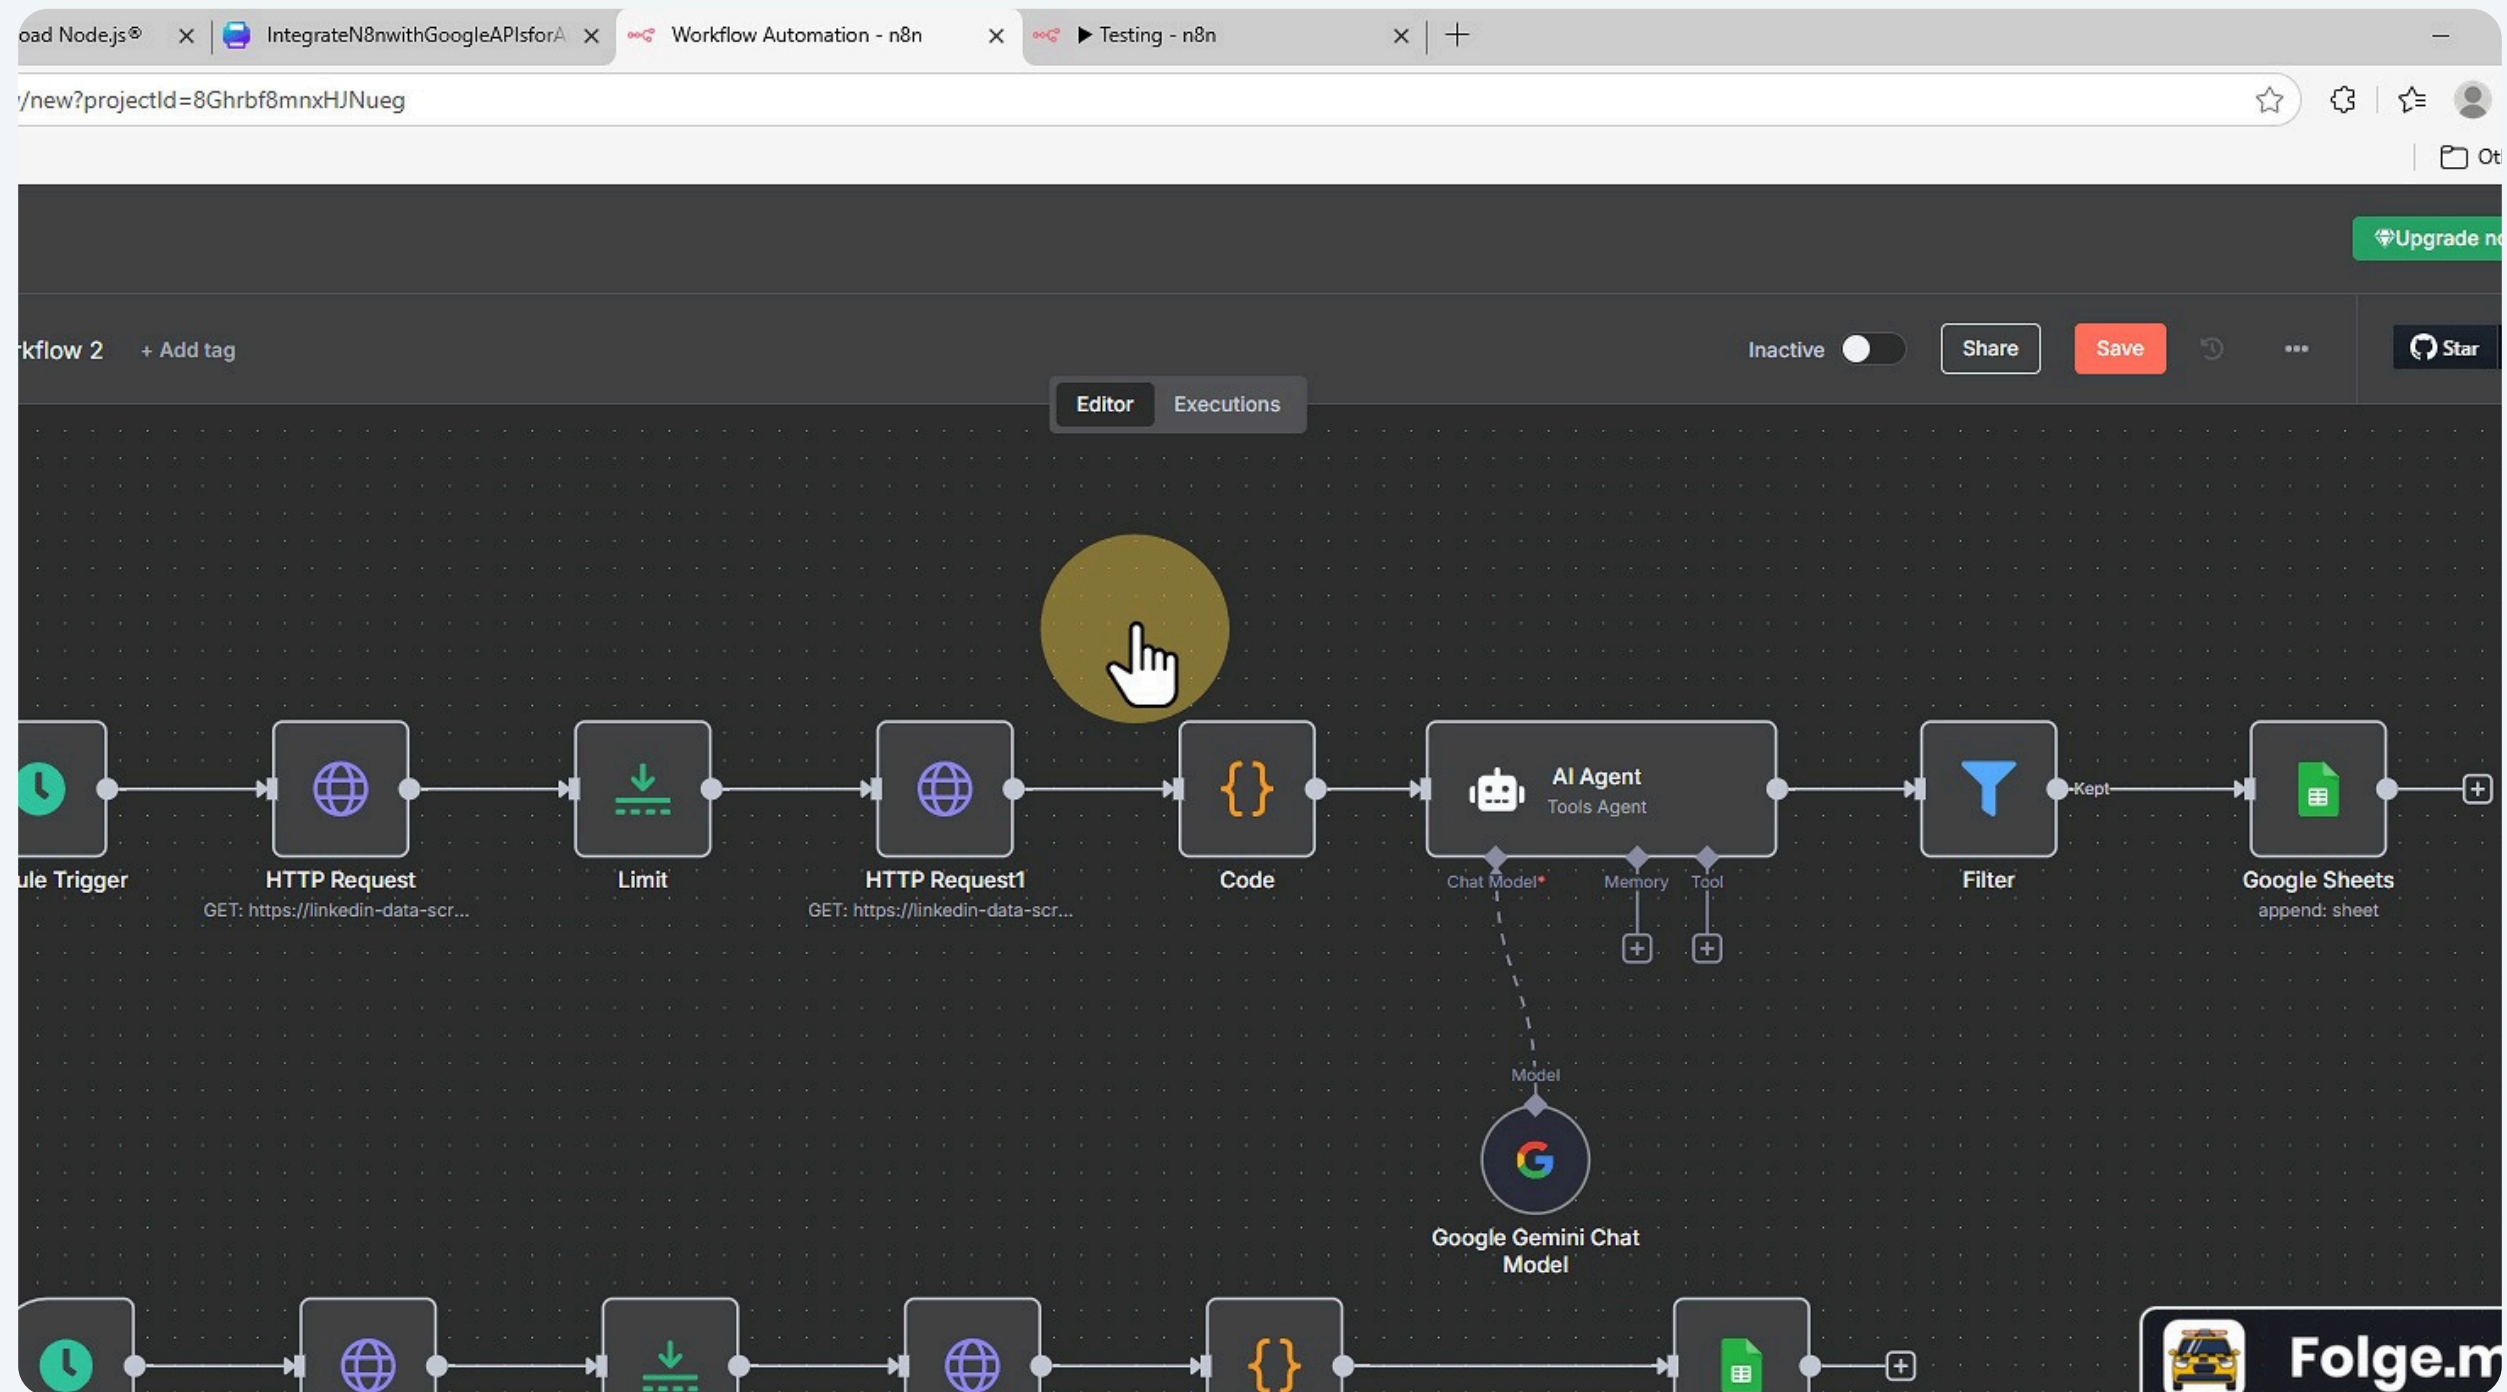

6 Choose the valid "json" File

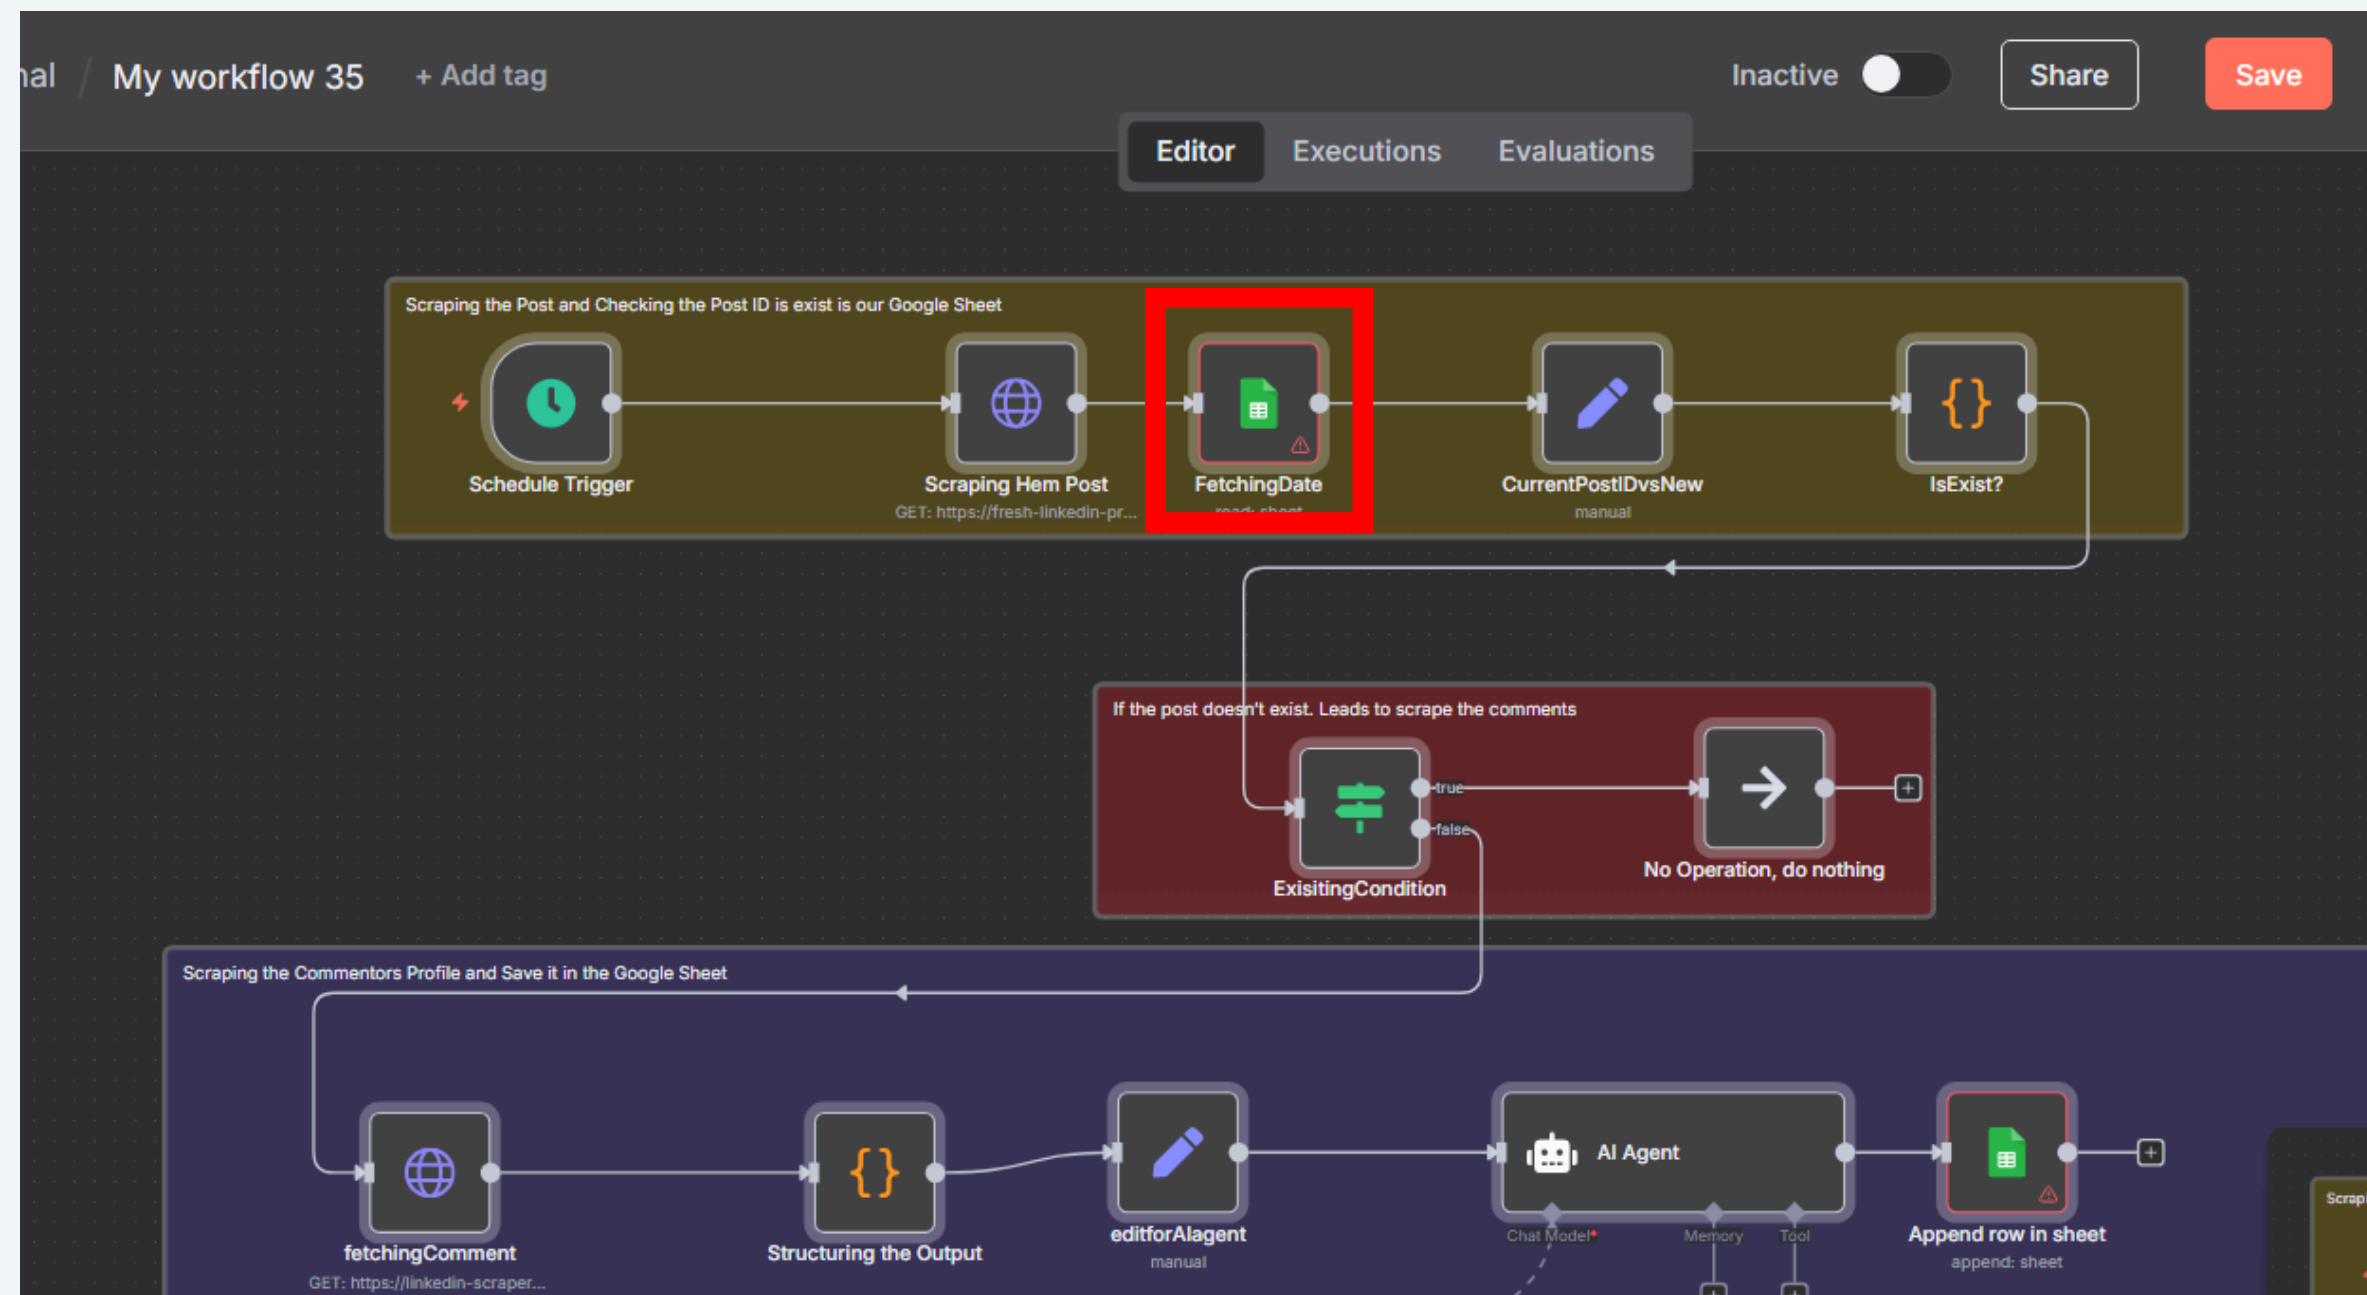

7 Open the "json" File

8 Now you have imported the Template

8 Update red nodes' credentials before running.

9 That's it, you are ready to GO!
